

Flying in a hot air balloon is not dangerous as such. For all aeronautical activities discipline and a minimal knowledge of the reactions of a hot air balloon, especially when landing, are required.

The undersigned declares that he has been informed of the following security measures and that he has noted that these measures have to be observed.

1. During inflating of the balloon and/or during the flight

- 1) Do not touch any of the ropes unless you are requested to do so.
- 2) Do not distract the pilot during the different operations.
- 3) Do not touch or hold on to any of the gas cylinders, or ropes of the balloon.

2. During landing, which can be hard

- 1) Bend your knees slightly to absorb the impact when landing.
- 2) Keep a firm hand on the appropriate handles in the basket.
- 3) Take care to avoid contact with parts of the balloon that could hurt you or be cause of injuries (fire extinguisher, gas cylinders, ...)
- 4) Keep both hands inside the basket.
- 5) Stay in the basket until the pilot gives permission to leave.

Follow the instructions of the pilot at all times.
